

A story (or sub-story) is marked as 'Done' once the following criteria has been met:

- The story description matches the functionality implemented
- All criteria of satisfaction are met by the new functionality implemented
- On top of visual quality assurance testing for front-end tasks, the story must also pass programmed unit tests for back-end tasks. Test cases must include end-to-end coverage:
 - Testing correct functionality (multiple different instances of this)
 - Testing response to incorrect user input (multiple different instances of this)
 - Endpoint and edge cases
 - Potential non-user related test cases (servers, REST calls, etc.)
 - Regression testing (ensure functionality has not negatively impacted previously functioning features)
- At least 2 other team members have reviewed the functionality and approved the change

In order to fully meet the product's potential we must ensure that we are producing 100% of what we have to offer. To have a perfect product, each stage of development must also be perfect. This way the product owner, the developers, and most importantly, the users are all satisfied with the product.
